Oral Health Knowledge, Attitude and Behavior Among Saudi 11-12 Year Old School Children

Oral Health Literacy

Oral health literacy is an essential skill for promoting and maintaining overall health and well-being, yet only half of the population visits a dentist each year. Poor and minority children are less likely to have access to oral health care than are their nonpoor and nonminority peers. Older adults, people who live in rural areas, and disabled individuals, uniformly confront access barriers, regardless of their financial resources. The consequences of these disparities in access to oral health care can lead to a number of conditions including malnutrition, childhood speech problems, infections, diabetes, heart disease, and premature births. Improving Access to Oral Health Care for Vulnerable and Underserved Populations examines the scope and consequences of inadequate access to oral health services in the United States and recommends ways to combat the economic, structural, geographic, and cultural factors that prevent access to regular, quality care. The report suggests changing funding and reimbursement for dental care, expanding the oral health work force by training doctors, nurses, and other non-dental professionals to recognize risk for oral diseases, and reauthorizing and expanding dental care programs. It also recommends changes to incorporate oral health care into overall health care. These recommendations support the creation of a diverse workforce that is competent, compensated, and authorized to serve vulnerable and underserved populations across the life cycle. The recommendations provided in Improving Access to Oral Health Care for Vulnerable and Underserved Populations will help direct the efforts of federal, state, and local government agencies, policy makers, health professions, and academic institutions, health care researchers, and philanthropic and advocacy organizations.

Oral Health Knowledge, Attitude and Practices of Parents

Oral health is one of the most overlooked areas of health in Ethiopia. The fact that very few researches were conducted in this area is a reflection of this neglect. This study is a humble contribution to the Dental Health advancement of Ethiopia. The book explores the knowledge, attitude and practice of school children as crucial parts of oral health. This quantitative study was conducted in two schools using a self-administered, structured questionnaire among 182 students who were randomly selected with stratified probability sampling technique. The study identified significant relationship of age, sex, socioeconomic status, and school type with oral health knowledge, attitude and practice of school children. It also proposes decisive measures that should be taken in family, school and health professional levels to ameliorate the oral health of school children in Ethiopia.

This introduction to Evidence-Based Dentistry provides a much-needed orientation in the subject for students and professionals alike. It is a ground-level book for those seeking to understand evidence-based dentistry and its significance for clinical practice. The book is anchored in the dental literature; the majority of the chapters offer guidance on interpreting a full published paper; where both the subject of the paper and the study design is of relevance to the field of dentistry. Each chapter is organized in a similar way, providing a structured approach to reading and understanding research articles or commercial product information. In this respect, Evidence-Based Dentistry is designed as an introduction to understanding published research and its implications for the dental surgery; rather than as a guide on undertaking research. It incorporates topical published papers in order to provide worked examples. Explains the most common forms of research used in dentistry. Unlocks basic statistical and epidemiological concepts, along with key terms. Enables the reader to identify the research question, assess aspects of study design, evaluate the strengths and weaknesses of papers and understand their clinical relevance. Tables, boxes and figures are used extensively to present core information. Useful templates are also provided, which readers may use/adapt for analysis, including study clubs.

The critical role which mothers play in shaping the oral hygiene habits adopted by their children made pregnant women a very important target group for oral health interventions. In Sudan there are currently no oral health programmes targeting pregnant women with a view to improving their own oral health and that of their children. In addition, hormonal changes during pregnancy together with other determinants of oral health affect their oral health. The aim of the study was to determine oral health status, knowledge, attitude and practices regarding oral hygiene among pregnant women attending Omdurman Maternity Hospital in Khartoum, Sudan. The oral health status of the pregnant women in this study was good despite the fact that they had hardly received any education on how to take care of their mouth and teeth. An integrated oral health education programme within the primary health care approach for pregnant women is recommended. A oral health screening and treatment package for pregnant women attending antenatal care in Sudan should be developed.

The Institute of Medicine (IOM) Roundtable on Health Literacy focuses on bringing together leaders from the federal government, foundations, health plans, associations, and private companies to address challenges facing health literacy practice and research and to identify approaches to promote health literacy in both the public and private sectors. The roundtable serves to educate the public, press, and
policy makers regarding the issues of health literacy, sponsoring workshops to discuss approaches to resolve health literacy challenges. It also builds partnerships to move the field of health literacy forward by translating research findings into practical strategies for implementation. The Roundtable held a workshop March 29, 2012, to explore the field of oral health literacy. The workshop was organized by an independent planning committee in accordance with the procedures of the National Academy of Sciences. The planning group was composed of Sharon Barrett, Bernard P. Dreyer, Alice M. Horowitz, Clarence Pearson, and Rima Rudd. The role of the workshop planning committee was limited to planning the workshop. Unlike a consensus committee report, a workshop summary may not contain conclusions and recommendations, except as expressed by and attributed to individual presenters and participants. Therefore, the summary has been prepared by the workshop rapporteur as a factual summary of what occurred at the workshop.
